

# AI literacy: Empowering People in Human-AI interactions

Cagatay Turkey

Professor,

Centre for Interdisciplinary Methodologies

University of Warwick

ELLITT Symposium, Norrköping, 15 May 2025

# AI literacy?

*“Providers and deployers of AI systems shall take measures to ensure, to their best extent, a sufficient level of AI literacy of their staff and other persons dealing with the operation and use of AI systems on their behalf, taking into account their technical knowledge, experience, education and training and the context the AI systems are to be used in, and considering the persons or groups of persons on whom the AI systems are to be used.”*

# AI literacy?

## What is AI Literacy? Competencies and Design Considerations

Authors:  [Duri Long](#),  [Brian Magerko](#) | [Authors Info & Claims](#)

[CHI '20: Proceedings of the 2020 CHI Conference on Human Factors in Computing Systems](#) • Pages 1 - 16  
<https://doi.org/10.1145/3313831.3376727>

*AI literacy as a set of competencies that enables individuals to critically evaluate AI technologies; communicate and collaborate effectively with AI; and use AI as a tool online, at home, and in the workplace.*

*“Providers and deployers of AI systems shall take measures to ensure, to their best extent, a sufficient level of AI literacy of their staff and other persons dealing with the operation and use of AI systems on their behalf, taking into account their technical knowledge, experience, education and training and the context the AI systems are to be used in, and considering the persons or groups of persons on whom the AI systems are to be used.”*

AI literacy	Definitions	N	Sample references
Know & understand AI	Know the basic functions of AI and how to use AI applications.	27	<i>Even though transparency in algorithms and AI in general has been <b>acknowledged</b> to be ethically important, the public lacks understanding of even the basic functions of AI. Efforts to make AI more comprehensible exist (Robinson, 2020).</i>
Use & Apply AI	Applying AI knowledge, concepts and applications in different scenarios.	30	<i><b>Apply</b> k-means clustering in science contexts.. explore the mapping relationship between facial features and data values and <b>apply</b> the concept to brainstorm other objects such as Lego (Wan et al., 2020).</i>
Evaluate & create AI	Higher-order thinking skills (e.g., evaluate, appraise, predict, design) with AI applications.	19	<i><b>Design &amp; build</b> experiences: Technology exploration and <b>creation</b> activities supported students in making sense of the underlying AI concepts. (Lee, 2020).</i>
AI ethics	Human-centered considerations (e.g., fairness, accountability, transparency, ethics, safety).	19	<i><b>“AI for social good”</b> measures an individual’s perception of the social environment surrounding the behavior, which is related to subjective norms (Chai et al., 2020).</i>

# Task Overview

# How does VIS empower people here?

- **Ability to bring in contextual knowledge**
  - Selecting relevant data features, e.g., those that relate to a particular social theory
  - Discarding data features / regions that are known to be problematic
- **Facilitating interpretation**
  - Explaining observations in dialogue with theory/knowledge, e.g., why do we see the model/pattern we are seeing
  - Generating knowledge based on the observations
- **Supporting translation to real-world actions**
  - Making decisions and taking actions based on the observations

Insight type	Description
Outstanding No.1	The leading value is significantly higher than all the remaining values.
Outstanding Top 2	The leading two values are significantly higher than all the remaining values.
Outstanding Last	The value is remarkably lower than all the remaining values.
Attribution	The leading value dominates (accounting for $\geq 50\%$ ) the group.
Change Point	A specific point in time where there is a significant change or shift in the underlying data-generating process.
Outlier	An observation or data point that significantly deviates from the rest of the data.
Seasonality	A regular and predictable pattern of fluctuations or variations that occur at specific intervals of time.
Trend	A time series has an obvious trend (increase or decrease) with a certain turbulence level (steadily/ with turbulence).
Correlation	The statistical relationships between random variables, multidimensional data or time series.
Difference	The similarity or difference between two or more datasets
Aggregation	The descriptive statistical indicators (e.g., average, sum, count, etc.) based on the data attributes.
Value	The the exact value of data attribute(s) under specific criteria.
Text summary	The core ideas of a text dataset. The summary might have spatial or temporal features.
Important nodes or links	The important nodes or links in a graph under specific criteria.
Important text or keywords	The important original texts or keywords under specific criteria.

You have selected a time period:19:09-19:18, during which there are 108 messages.

What are the main events in high-risk regions?

You have selected a time period:19:35-19:43, during which there are 270 messages.

b What are the main events in high-risk regions?

Summary added.

c Which messages are related to these events?

Related messages found.

d Which nodes are related to these events?

Related nodes found.

You added a keyword **van** into events list.

e Which events related to this keyword?

Story added to timeline.

Type a question...

### **Prompt template for insight type selection:**

When the user makes an action, the system changes. You should analyze data types of connected views based on the coordination information between views.

{ current selection }

{ view style info }

{ views coordination info }

According to the data info in each view and the analytical task, you should select all suitable analytical functions related to the user's task. You also need to give a relevance score to assess how closely related the insight is to the task.

{ analytical task }

{ insight function APIs }

Please give your answer in the following format:

{ format requirements }

According to the data info in each view and the analytical task, you should select all suitable analytical functions related to the user's task. If a view contains more than one measure, all measures need to be considered to find appropriate functions. Cross-view insights, such as correlation, are allowed. You also need to give a relevance score to assess how closely related the insight type is to the task.

```

Type	Specific questions
<b>R1:</b> Perceptual visual encoding	<b>O1:</b> What do the visual encoding and corresponding data mean for the timeline view?
	<b>S1:</b> Do you know what each data variables means?
	<b>S2:</b> Do you understand the meaning of the visual elements?
<b>R2:</b> Interaction and Coordination	<b>O2:</b> How the timeline view coordinated with other views?
	<b>S3:</b> Are you clear on how to interact in each view?
	<b>S4:</b> Are you clear on how the views are related?
<b>R3:</b> Data Pattern Discovery	<b>O3:</b> What high-risk level events occurred in the peak period?
	<b>S5:</b> Is it easy to get data findings (such as events, key nodes) in these views?
<b>R4:</b> Hypothesis Formulation and Validation	<b>O4:</b> What are the key player and location of the summarized event?
	<b>S6:</b> Are you clear about the next step analysis for validation?
	<b>S7:</b> Do you have easy access to rich hypotheses?
<b>R5:</b> Summarization of Exploration Results	<b>O5:</b> Discover related events of the keyplayer and summarize them into a report.
	<b>S8:</b> Is it easy to write an analysis report on the interaction results?
	<b>S9:</b> Are you satisfied with the quality of the report you wrote?

# How AI empowers people?

**As an interaction mechanism**, i.e., natural language interface to functionality, lowering barriers

**As a guidance mechanism**

- Suggestions/recommendations: data sections to inspect for fuller data/pattern coverage

**By communicating disclaimers/assumptions/additional context**, e.g., model/data assumptions – improving the quality and rigour of the process and insights drawn

# empowering people

**Human Agency**

# Moving from Explainability to Actionability

Move beyond understanding AI decisions to empowering action.

*Can explanations empower users to identify and challenge mistakes when algorithms go wrong?*

**Explainability → Actionability (Contestation as an action)**

An Actionability Assessment Tool for Explainable  
AI

Ronal Singh, Tim Miller, Liz Sonenberg, Eduardo Velloso, Frank Vetere, Piers Howe, Paul Dourish

*“An explanation of a decision is actionable if people can use the information to identify actions to take to change the decision”*

# Research Note

24 February 2025

Credit where credit is due:  
how can AI's role in credit  
decisions be explained?

Cameron Belton, Daniel Bogiatzis-Gibbons, Isaac  
Keeley, Jackie Spang, Cagatay Turkay, Yulu Pi

**What?:** to explore how different methods ('genres') of explaining AI-assisted decisions about creditworthiness can empower users to better **understand whether an AI-assisted decision is appropriate for them** and to what extent they **enable people to contest the decision**

1

## Sampling & Task Setting

A sample of  
N = 8708 UK adults

.. asked to imagine themselves as someone receiving an **AI-assisted decision** to a credit card application

Each participant is assigned to one of the explanation **genre** groups

2

## Explanation genre groups

Explanations involve ...

data

data features

logical rules

Four explanations **genres**

G1:

G2:

G3:

G4:

3

## Ability to Assess AI Decisions

Each participant considers five hypothetical credit application **scenarios** all explained with their assigned **genre** ..

Two correct decisions

Correct Acceptance

Correct Rejection

Wrong Rejection: input data error

Wrong Rejection: over-reliance on one feature

Wrong Rejection: failure to consider relevant information

Three incorrect decisions with distinct **error types**

.. and asked, do you ..

ACCEPT

or

CHALLENGE

.. the **AI-assisted decision** and then asked **WHY?**

4

## Comprehension Test

After doing the task once, they are then asked to complete a comprehension test on:

Role of algorithm in credit decision-making

Feature Effect

Feature Importance

5

## Attitude Survey

After doing the task four more times, they are then asked to complete a survey on:

Importance of Information

Helpfulness of Information

Sufficiency of Information

Confidence in Disagreement

# Profile Summa

## Profile 1: Correct acceptance

Your profile (about you):

- Debt collection accounts opened in last 24 months: 0
- Late payments or overdue accounts in last 24 Months: 0
- Percentage of credit that you've already paid off: 100%
- Percentage of available credit that you're using: 11%
- Annual income: £40,000
- Current total credit card limit: £2,300

Message received from the credit provider:

Thank you for your application for our Regular Credit Card. We would like to inform you that the result of your application is: **Accepted**

We have a tool that uses algorithms to assess credit card applications. The tool doesn't make decisions on its own and the application would not be rejected by the tool alone, but it helps our credit card officers find applications that might have a higher risk of not being repaid.

How the algorithm helped us make this decision:

We use information about you to see how your application compares to other people's data in our system. This helps us understand your situation better. The table below shows information about you, how it compares to the average of past applicants, and where the information came from. However, not all the information shown below is always considered by the algorithm.

Information type	Your information	Average for our past applicants	Source of information
Debt collection accounts opened against you in last 24 months	0	0.10	Credit reporting agencies
Late payments or overdue accounts in last 24 months	0	0.14	Credit reporting agencies
Percentage of credit that you've already paid off now	100%	47%	Credit reporting agencies
Percentage of credit limit that you're using	11%	38%	Credit reporting agencies
Annual income	£40,000	£43,166	You provided
Current total credit card limit	£2,300	£10,257	Credit reporting agencies

If you believe there is something wrong with how the algorithm assisted us in making the decision, **you can challenge the decision**. Please note that we can only reconsider the decision if you provide a **valid, appropriate reason** for why you'd like to challenge the decision.

## Profile 2: Correct rejection

Your profile (about you):

- Debt collection accounts opened in last 24 months: 0
- Late payments or overdue accounts in last 24 Months: 0
- Percentage of credit that you've already paid off: 100%
- Percentage of available credit that you're using: 11%
- Annual income: £40,000
- Current total credit card limit: £2,300

Message received from the credit provider:

Thank you for your application for our Regular Credit Card. We would like to inform you that the result of your application is: **Rejected**

We have a tool that uses algorithms to assess credit card applications. The tool doesn't make decisions on its own and the application would not be rejected by the tool alone, but it helps our credit card officers find applications that might have a higher risk of not being repaid.

How the algorithm helped us make this decision:

We use information about you to see how your application compares to other people's data in our system. This helps us understand your situation better. If you believe there is something wrong with how the algorithm assisted us in making the decision, **you can challenge the decision**. Please note that we can only reconsider the decision if you provide a **valid, appropriate reason** for why you'd like to challenge the decision.

**Reason:**  
failure to consider relevant feature

*\*Please note: All profile examples from control*

Genre-1:

Data-centric explanation

Information type	Your information	Average for our past applicants	Source of information
Debt collection accounts opened against you in last 24 months	1	0.10	Credit reporting agencies
Late payments or overdue accounts in last 24 months	0	0.14	Credit reporting agencies
Percentage of credit that you've already paid off now	100%	47%	Credit reporting agencies
Percentage of credit limit that you're using	11%	38%	Credit reporting agencies
Annual income	£180,000	£43,166	You provided
Current total credit card limit	£6,000	£10,257	Credit reporting agencies

**Genre-2:**  
Features-based explanation

Information type	Your application	Importance of information	Effect of information
Debt collection accounts opened against you in last 24 months	1	Most important	Decreased your likelihood of approval

**Genre-3:**

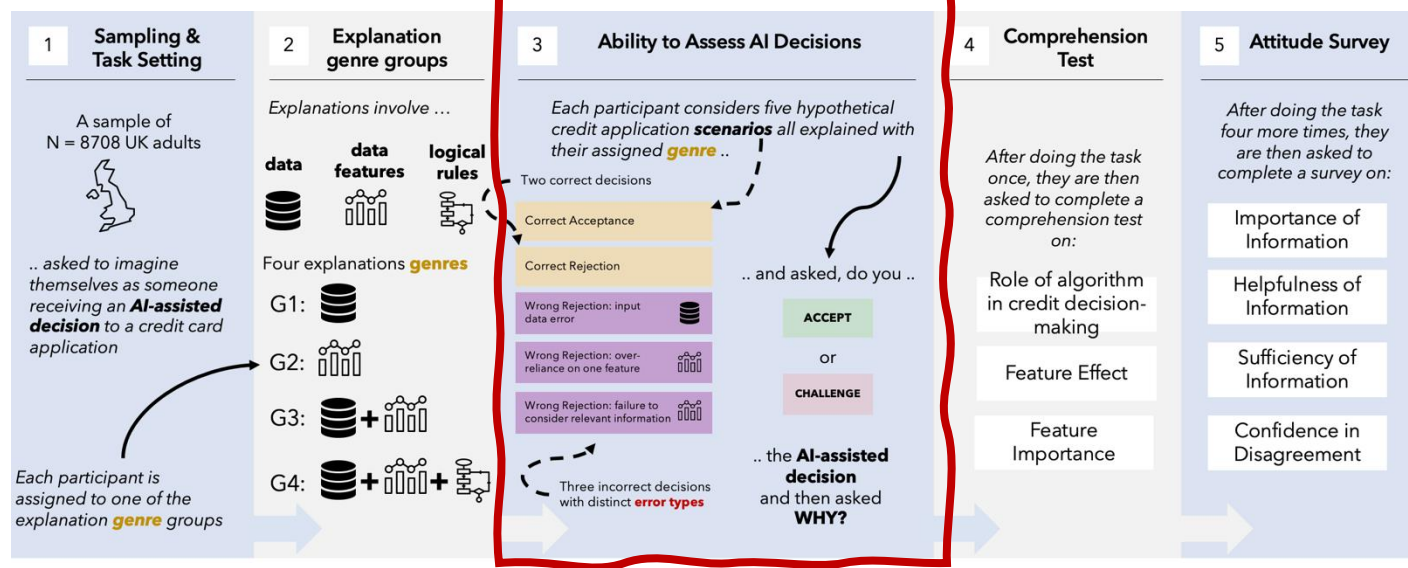

Data-centric + Features-based explanation

Information type	Your application	Average for past applicants	Importance of information	Effect of information	Source of information
Debt collection accounts opened against you in last 24 months	1	0.10	Most important	Decreased your likelihood of approval	Credit reporting agencies

**Genre-4:**  
Data + Features + Decision Logic  
explanation

Information type	Your application	Average for past applicants	Importance of information	Effect of information	Source of information
Debt collection accounts opened against you in last 24 months	1	0.10	Most important	Decreased your likelihood of approval	Credit reporting agencies

**The following decision rule was applied:**  
If debt collection accounts opened against you in last 24 months is greater than 0.5 then Reject the application

**Table 6: Error Types and Corresponding Correct Reasons for Contestation**

Error Type	Correct Contestation Reason
<b>Incorrect Data Input</b> (Scenario 3)	"I would like to challenge the decision because my information has been entered into the algorithm incorrectly"
<b>Overreliance on One Feature</b> (Scenario 4)	"I would like to challenge the decision because the algorithm is over-relying on one piece of information and not considering other important pieces of information"
<b>Failure to Consider Relevant Features</b> (Scenario 5)	"I would like to challenge the decision because the algorithm is not considering a piece of information that is important for the decision"

# Explanation Details and Error Types Influence the Capacity to Identify AI Errors

# Increased Confidence and Perceived Information Sufficiency Despite Decreased Performance

# Ability to contest effectively

(i.e., correctly judge an incorrect decision *and* identify the relevant error)

... not great..

**Error type:** Incorrect prediction due to data input error (**Profile 3**)

Treatment	% identifying correct error having said that decision was incorrect*
Data-centric	69%
Features-based	81% <b>(+12pp)</b>
Combination data-centric/features-based	78% <b>(+9pp)</b>
Combination data/features + rules	79% <b>(+10pp)</b>

**Error type:** Misclassification due to overreliance on one feature (**Profile 4**)

Treatment	% identifying correct error having said that decision was incorrect*
Data-centric	18%
Features-based	12% <b>(-6pp)</b>
Combination data-centric/features-based	15% <b>(-3pp)</b>
Combination data/features + rules	15% <b>(-3pp)</b>

**Error type:** Misclassification due to failure to consider relevant features (**Profile 5**)

Treatment	% identifying correct error having said that decision was incorrect*
Data-centric	62%
Features-based	41% <b>(-21pp)</b>
Combination data-centric/features-based	45% <b>(-17pp)</b>
Combination data/features + rules	44% <b>(-18pp)</b>

# Understanding Public Attitudes to AI

Understanding public awareness, experience and attitudes towards different uses of artificial intelligence

'To what extent do you think that the use of this technology will be beneficial?'

Very Somewhat Don't know / Prefer not to say  
Not very Not at all

'Which of the following, if any, would make you more comfortable with AI technologies being used?'

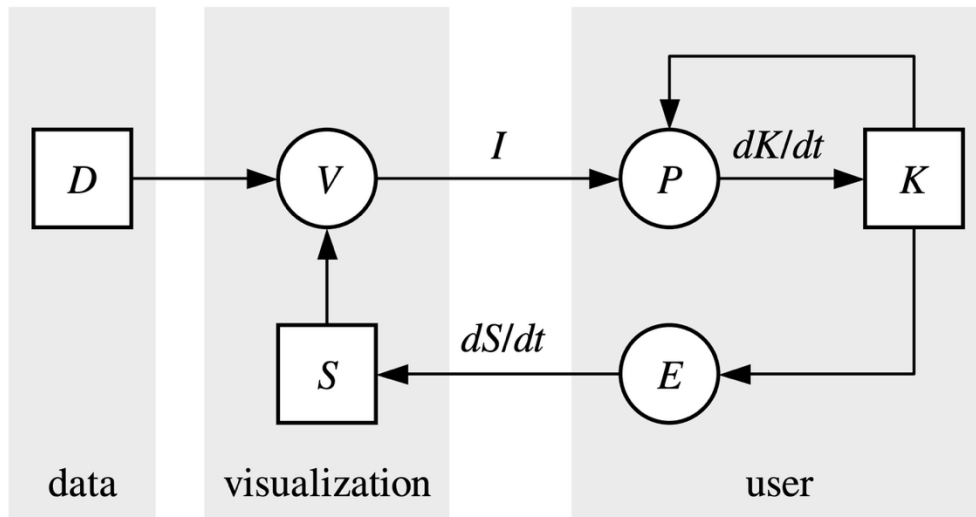

## C2: Balancing what people & AI are best at

Reflecting on what's difficult, complex, valuable in human-AI interaction?

How to distribute the tasks?

[van Wijk, 2005]

### Moravec's paradox

*“It is comparatively easy to make computers exhibit adult level performance on intelligence tests or playing checkers, and difficult or impossible to give them the skills of a one-year-old when it comes to perception and mobility.”*

### **C3: limited means of expression for “human input”**

- Are we providing sophisticated enough means for people to express themselves? e.g., contestation, relabelling?
- What is the “bandwidth” of interaction in interactive data analysis?

### **C3: Existing algorithms (AI) are not setup for humans-in-the-loop**

- e.g., You can contest a decision but what does that mean for the next person?
- Can models learn meaningfully from human input? Are new AI models too intractable by design?

# A few final reflections..

**Critical, informed and rigorous** engagements with data, models and AI artefacts for everyone

Is the loop really a loop? Tighter/deeper involvement of the human and new algorithms to “***close the loop***”

everyday human-AI interactions

# Thanks ..
